

## Week17: IEEE-CIS Fraud Detection

발표자: 이지호, 김희숙

## 목치

#01 Fraud detection competition

#02 Tackling Class Imbalance by Resampling

#03 Result

#04 Algorithmic Ensemble techniques

#05 Resampling technique vs. ensemble method

# 대회 소개

### #01 대회 소개 IEEE-CIS Fraud Detection

#### 대회 개요

• Vesta 사에서 제공하는 전자 상거래 transaction 및 feature 데이터셋을 활용해 사기탐지 모델 작성하기.

#### 데이터 셋

- Features
  - Transaction Table \*
  - TransactionDT: timedelta from a given reference datetime (not an actual timestamp)
  - TransactionAMT: transaction payment amount in USD
  - ProductCD: product code, the product for each transaction
  - card1 card6: payment card information, such as card type, card category, issue bank, country, etc.
  - · addr: address
  - dist: distance
  - P\_ and (R\_\_) emaildomain: purchaser and recipient email domain
  - C1-C14: counting, such as how many addresses are found to be associated with the payment card, etc. The actual meaning is masked.
- D1-D15: timedelta, such as days between previous transaction, etc.
- M1-M9: match, such as names on card and address, etc.
- Vxxx: Vesta engineered rich features, including ranking, counting, and other entity relations.

#### < sample\_submission.csv (6.08 MiB)

#### **Dataset Imbalance**

• We will discuss about class imbalance problem which is occus often more in problems like fraudulent transaction identification and spam identification

#### Target variable

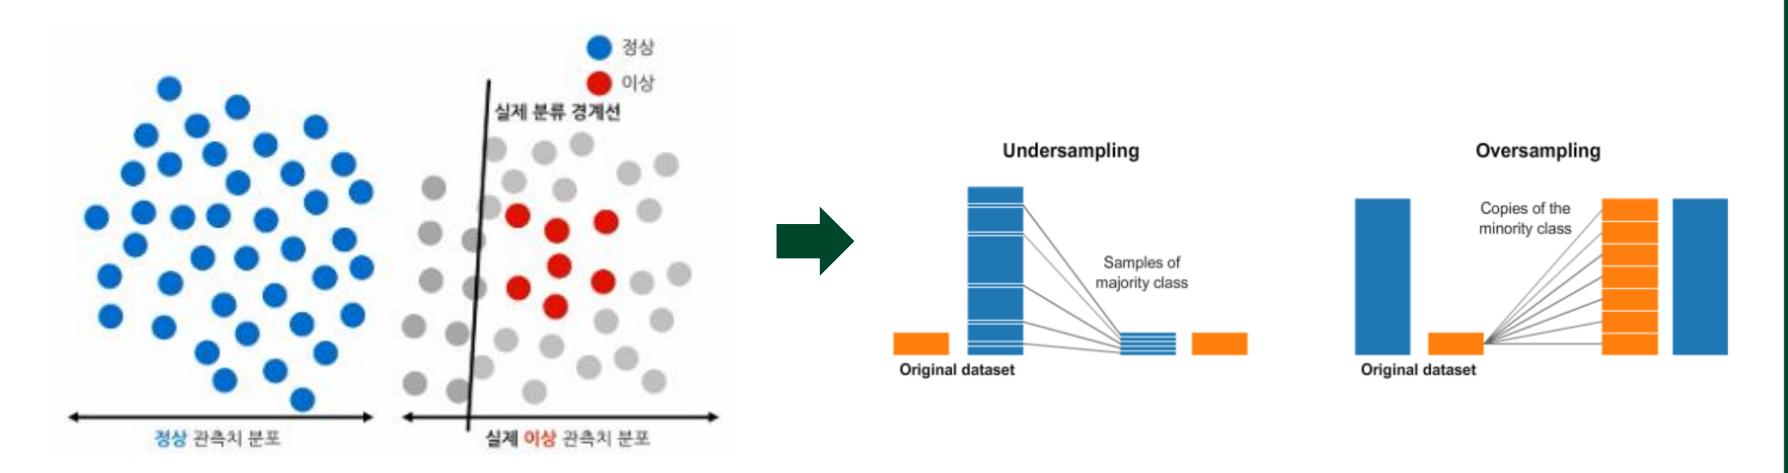

```
x=train_transactions['isFraud'].value_counts().values
sns.barplot([0,1],x)
plt.title('Target variable count')
```

- There is clearly a class imbalance problem.
- 보통 데이터 양이 적은 이상 데이터가 target 값이 되는 경우가 많다 (사기 거래 < 정상 거래, 암 환자< 암에 걸리지 않은 환자)
- 정상 데이터를 정확히 분류하는 것보다, 이상 데이터를 정확이 분류하는 것이 더 중요하다.

#### Resampling: solving dataset imbalance problem

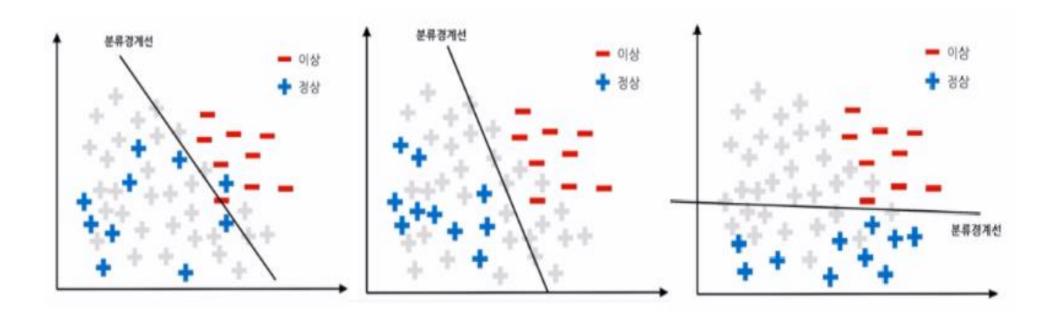

- A widely adopted technique for dealing with highly unbalanced datasets is called resampling.
- > Under sampling: removing samples from the majority class
- > Oversampling: adding more examples from the minority class
- ➤ Sampling 적용 전 PCA, T-SNE등의 Dimension reduction 기법 적용

#### **Under-sampling**

#### 1. Random under sampling

```
from imblearn.under_sampling import RandomUnderSampler
ran=RandomUnderSampler(return_indices=True) ##intialize
X_rs, y_rs, dropped = ran.fit_sample(X,y)
print("The number of removed indices are ",len(dropped))
plot_2d_space(X_rs,y_rs,X,y,'Random under sampling')
```

▶ imblearn(imbalance learning)모듈을 이용해 불균형 데이터를 처리할 수 있다.

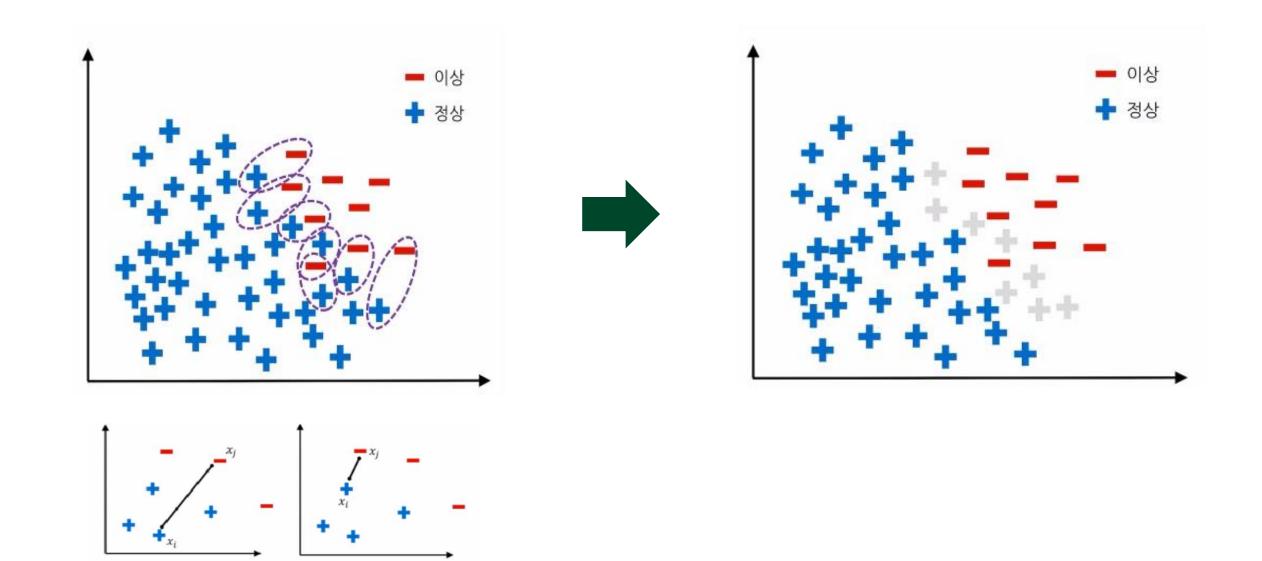

- ➤ Random sampling 이므로 시행 시마다 다른 결과를 낳는다. ➤ 샘플링 시행마다 모델의 성능이 달라지는 문제.

#### **Under-sampling**

#### 2. Tomek Links

- ➤ 서로 다른 클래스의 데이터 두 점을 연결해 그 거리가 짧은 Tomek Link를 찾는다.
- ➤ 모든 tomek link를 색출하고, 그 중 다수의 클래스(정상치)에 해당하는 데이터를 삭제한다.
- ➤ Results

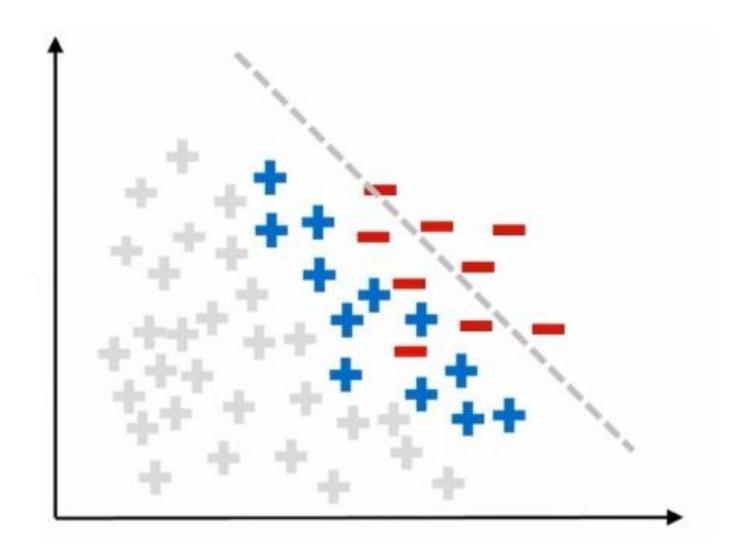

#### **Under-sampling**

#### 3. Condensed Nearest Neighbor(cnn) Rule

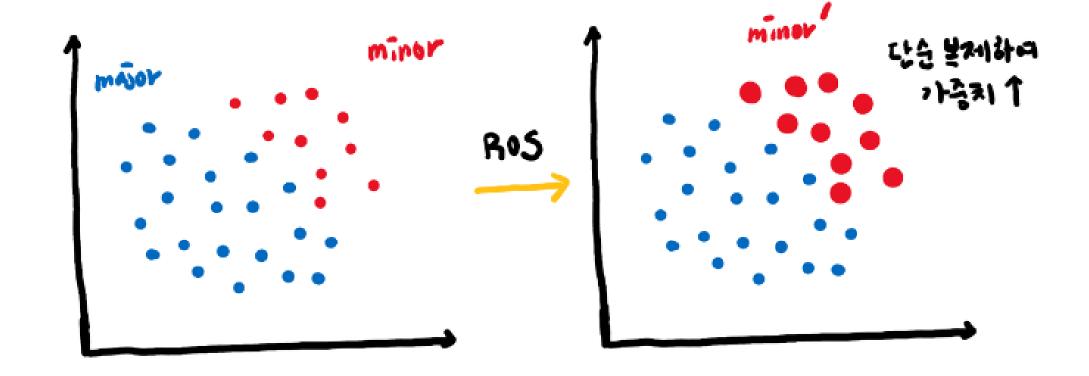

- ➤ K=1인 k-NN(1-NN)을 이용
- ▶ 정상치(다수 클래스)와 이상치(소수 클래스)에서 각각 하나씩 데이터를 무작위 추출한 sub-dataset을 구성한다
- ➤ 정상치 데이터 값을 하나씩 sub-datset과의 1-NN을 따져본다.
- ➤ 정상치와 가까웠던 값들을 under sampling 해 준다.

#### **Over-sampling**

#### 1. Resampling

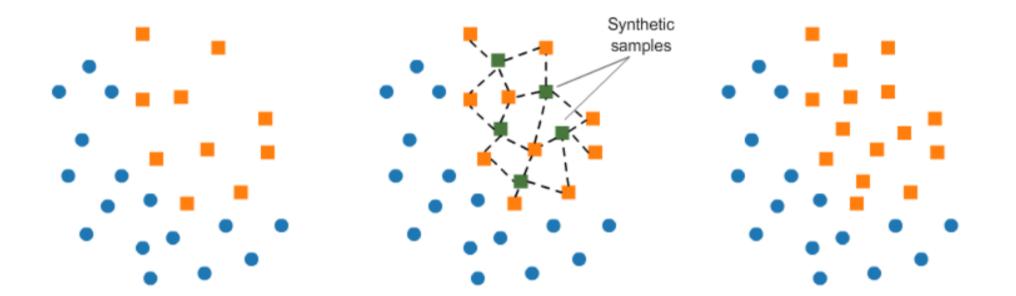

- ▶ 기존에 존재하는 소수의 클래스를 단순히 복제하여 비율을 맞춰주는 것.
- ▶ 똑같은 데이터가 증식되다 보니 오버피팅의 위험

#### **Over-sampling**

#### 2. SMOTE(Synthetic Minority Oversampling Technique)

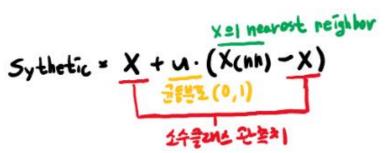

```
from imblearn.over_sampling import SMOTE

smote = SMOTE(ratio='minority')
X_sm, y_sm = smote.fit_sample(X, y)

plot_2d_space(X_sm, y_sm, X, y, 'SMOTE over-sampling')
```

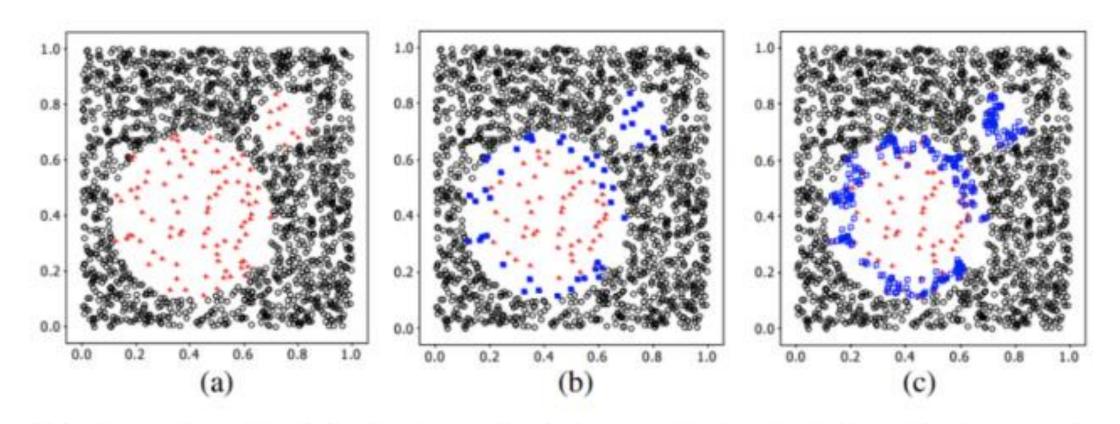

- > SMOTE (Synthetic Minority Oversampling Technique) consists of synthesizing elements for the minority class, based on those that already exist. It works randomly picingk a point from the minority class and computing the k-nearest neighbors for this point. The synthetic points are added between the chosen point and its neighbors.
- ▶ 사전에 정한 k개의 이상치 데이터에 synthetic 공식을 적용해 가상의 데이터를 계산해 낸다.

#### **Over-sampling**

#### 3. Borderline - SMOTE

- 1. k = k' : Noise 관측치
- 2. k/2 < k' < k : Danger 관측치
- 3. **□**0 =< k' =< k/2 : Safe 관측치

Fig. 1. (a) The original distribution of Circle data set. (b) The borderline minority examples (solid squares). (c) The borderline synthetic minority examples (hollow squares).

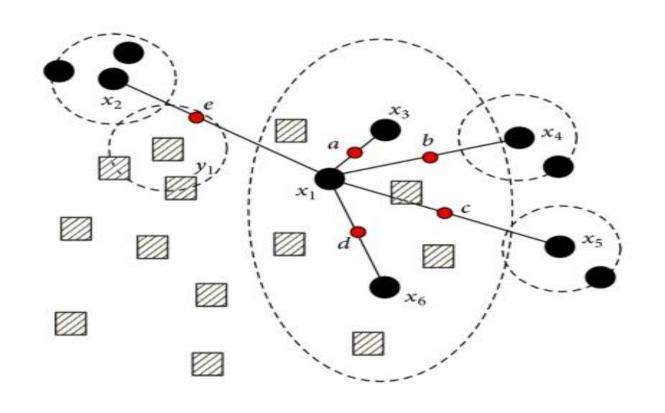

- ➤ 경계 값(borderline)으로 판별된 이상치 데이터에만 SMOTE oversampling을 적용하는 방법
- ➤ K개의 nearest neighbor를 찾는다. 그 neighbor 관측치들의 클래스에 따라 borderline 인지 평가한다.

#### **Over-sampling**

#### 4. ADASYN(Adaptive Synthetic Sampling Approach)

- ➤ Borderline-SMOTE와 유사하지만, 데이터의 위치에 따라 유동적으로 sampling 개수(k)를 다르게 설정한다.
- ▶ 모든 소수 클래스 데이터 각각에 대해 k개의 주변 데이터를 탐색하고, 그중 다수(정상치)클래스 비율을 계산한다. (R\_i)
- ➤ R\_i \* (정상치 클래스 개수 소수 클래스 개수)를 곱해주고 반올림한다. 이렇게 얻은 정수 값 만큼 SMOTE를 적용해 oversampling 해 준다.

- Majority class samples
- Minority class samples
- Synthetic samples

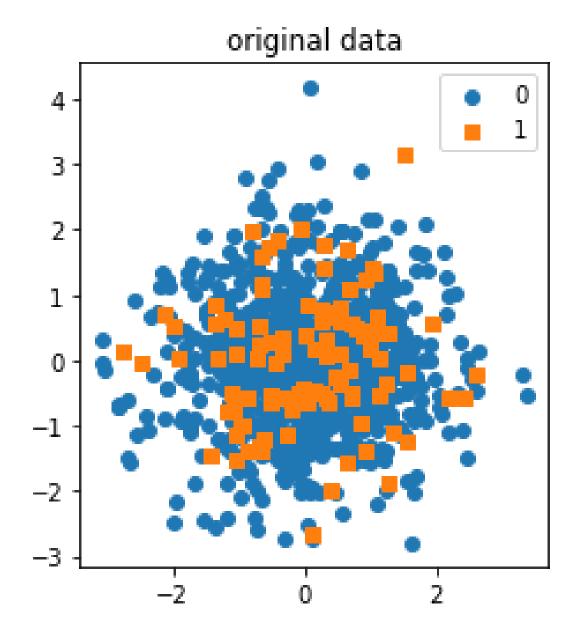

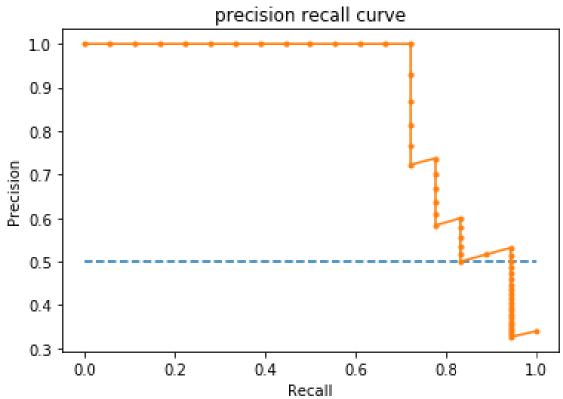

## Result

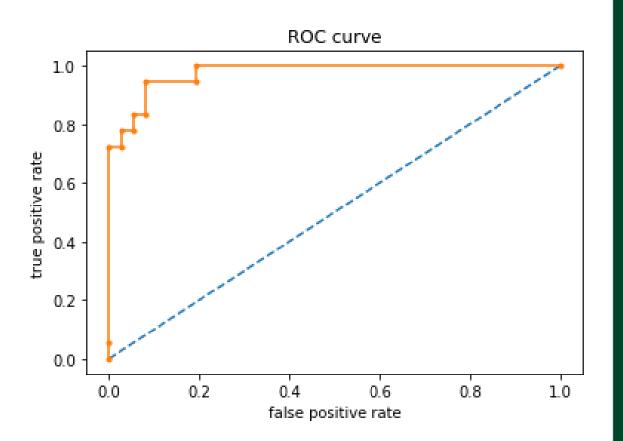

#### Original data

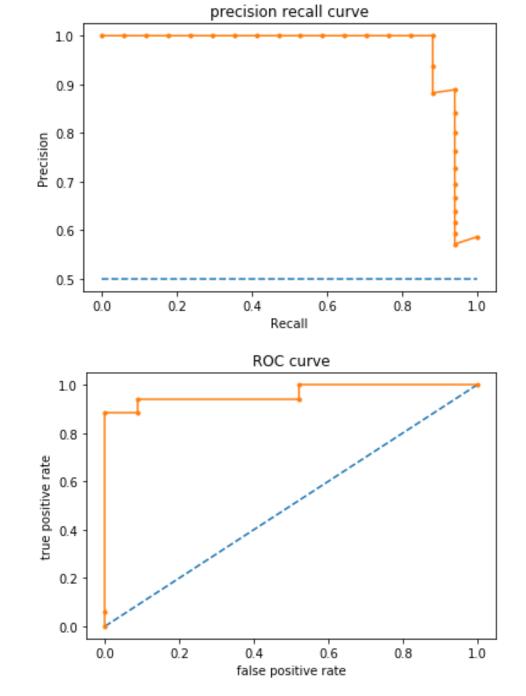

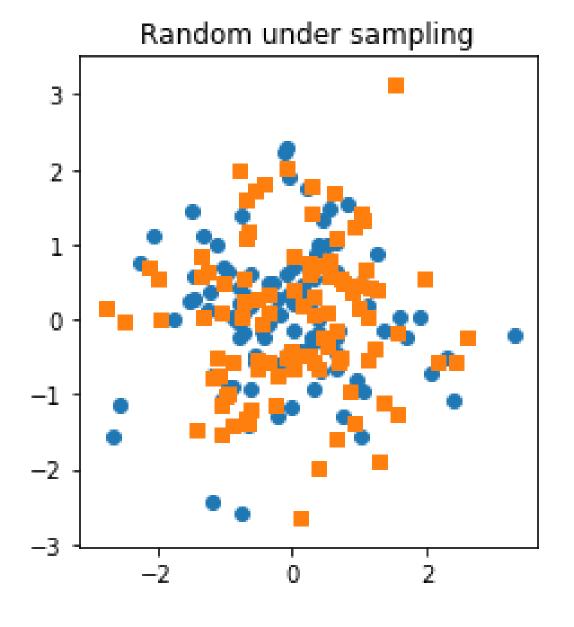

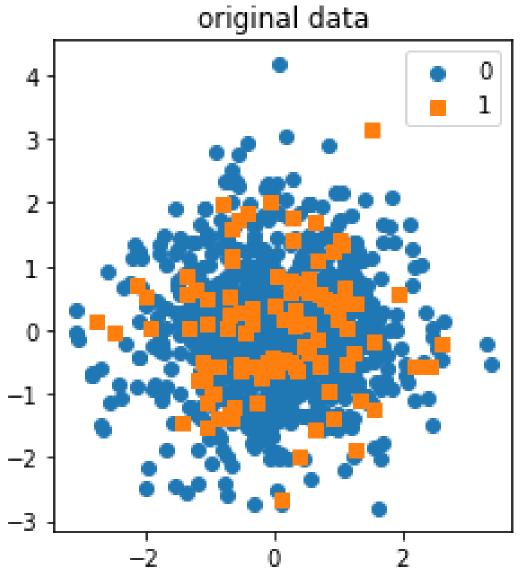

#### Random under-sampling with imbalanced-learn

• The number of removed indices are 200

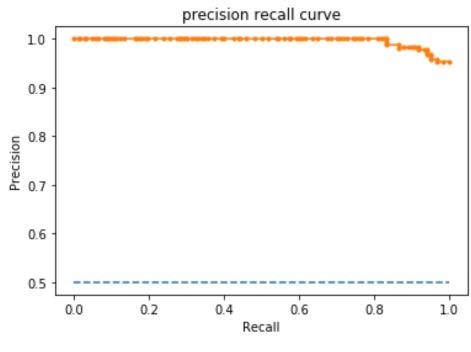

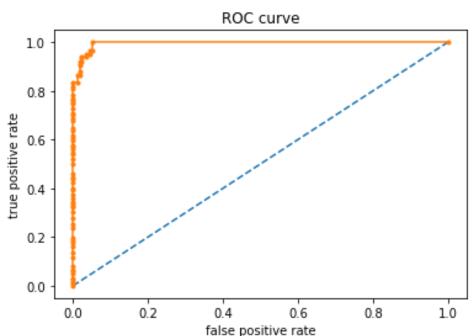

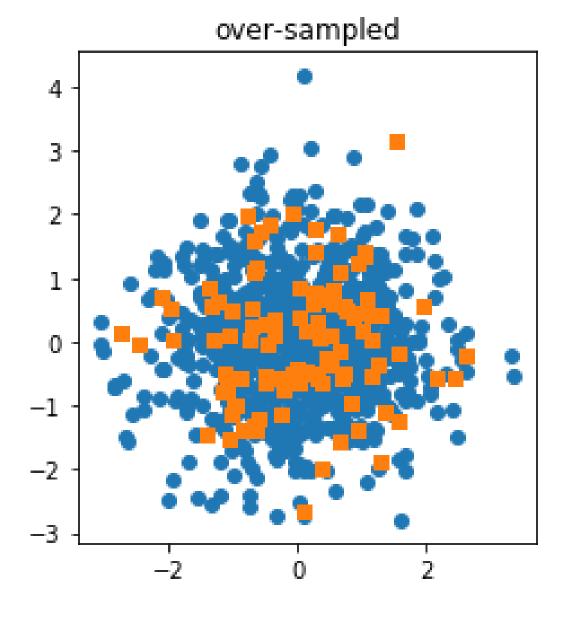

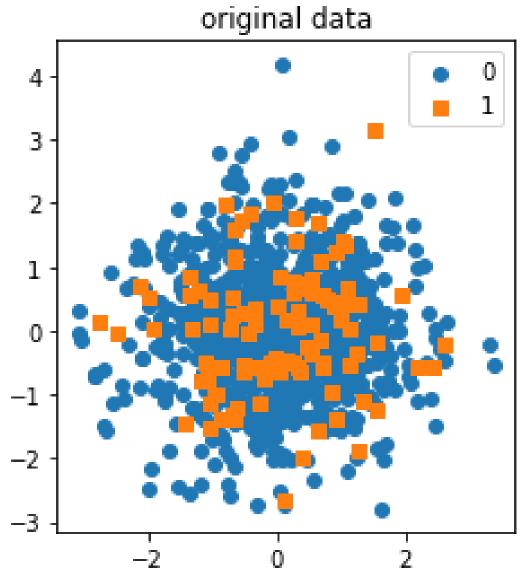

#### Random over-sampling with imbalanced-learn

• The new data contains 1800 rows

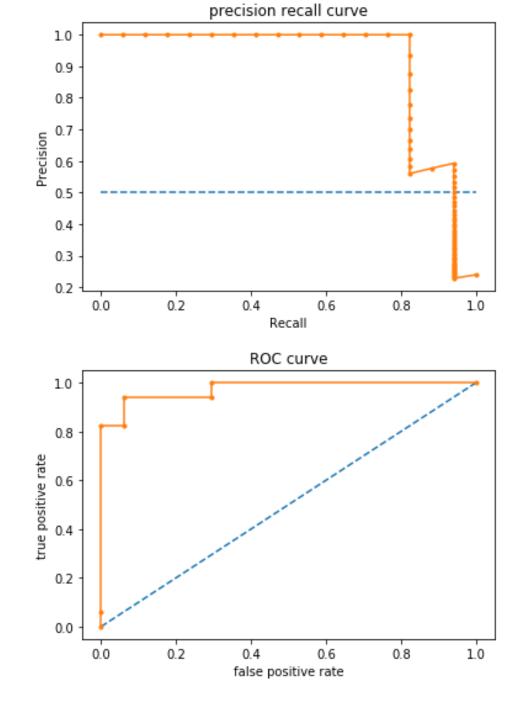

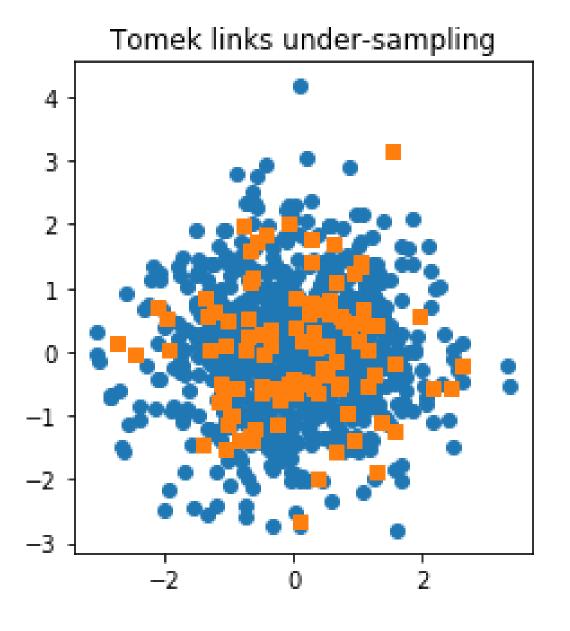

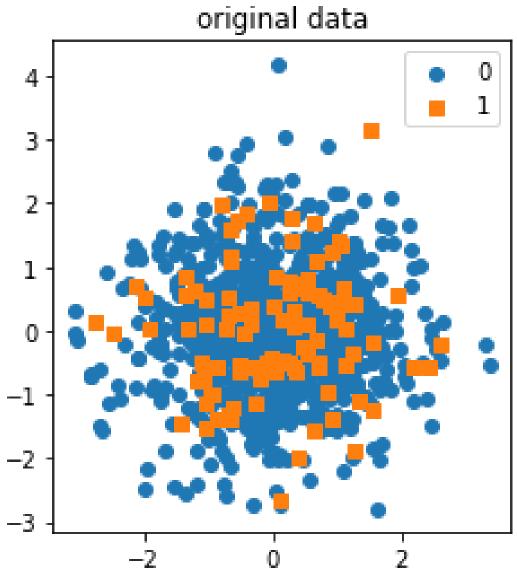

#### Tomek links : Under-sampling

• The number of removed indexes are 996

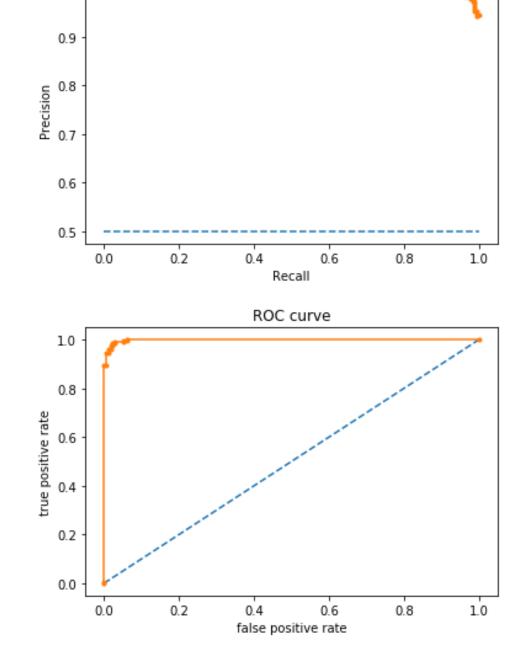

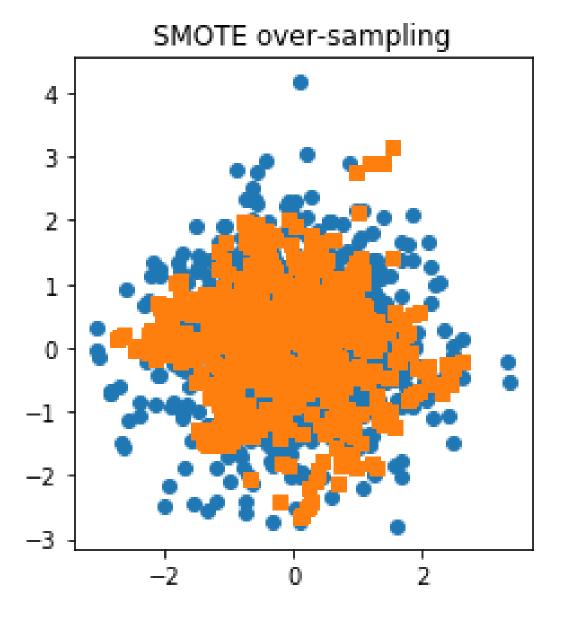

1.0

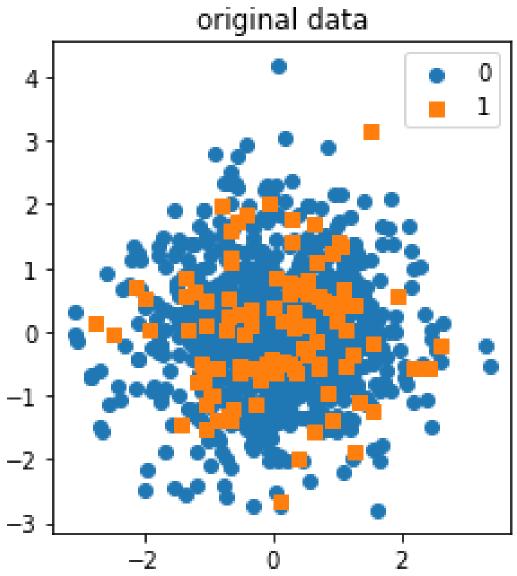

#### SMOTE : Over-sampling

precision recall curve

• The new data contains 1800 rows

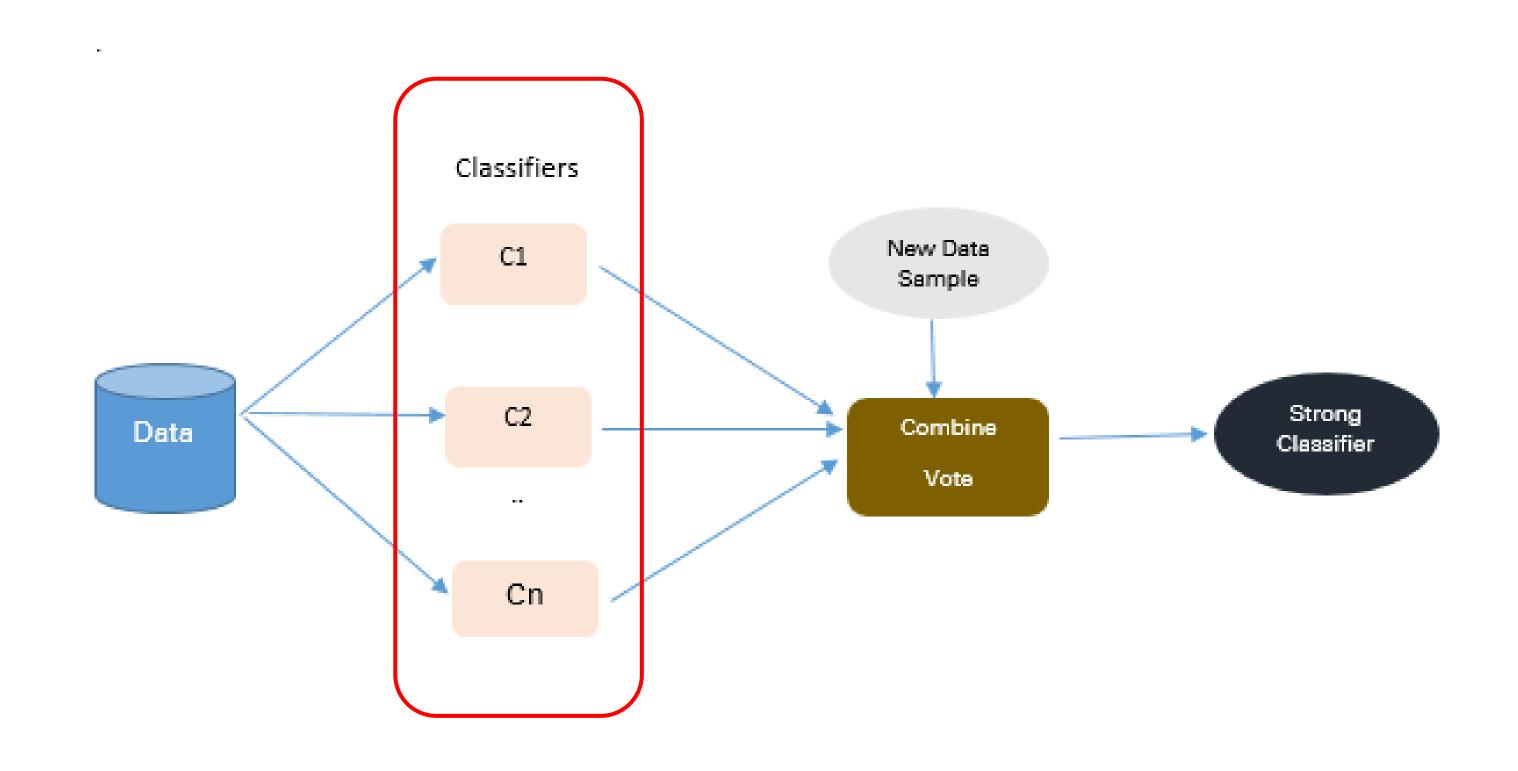

# Algorithmic Ensemble techniques

## #04 Algorithmic Ensemble techniques

Ensemble techniques

## #04 Algorithmic Ensemble techniques

#### XGBoost

(Class Weighted XGBoost or Cost-Sensitive XGBoost)

```
# fit xgboost on an imbalanced classification dataset
from numpy import mean
from sklearn.datasets import make_classification
from sklearn.model_selection import cross_val_score
from sklearn.model_selection import RepeatedStratifiedKFold
from xgboost import XGBClassifier
# generate dataset
X, y = make_classification(n_samples=10000, n_features=2, n_redundant=0, n_clusters_per_class=2, weights=[0.99], flip_y=0, random_state=7)
# define model
model = XGBClassifier()
# define evaluation procedure
cv = RepeatedStratifiedKFold(n_splits=10, n_repeats=3, random_state=1)
# evaluate model
scores = cross_val_score(model, X, y, scoring='roc_auc', cv=cv, n_jobs=-1)
# summarize performance
print('Mean ROC AUC: %.5f' % mean(scores))
```

scale\_pos\_weight
hyperparameter is set to the value of 1.0 and has

the effect of weighing the balance of positive examples, relative to negative examples when

boosting decision trees. For an imbalanced binary classification dataset, the negative class refers to

the majority class (class 0) and the positive class

refers to the minority class (class 1).

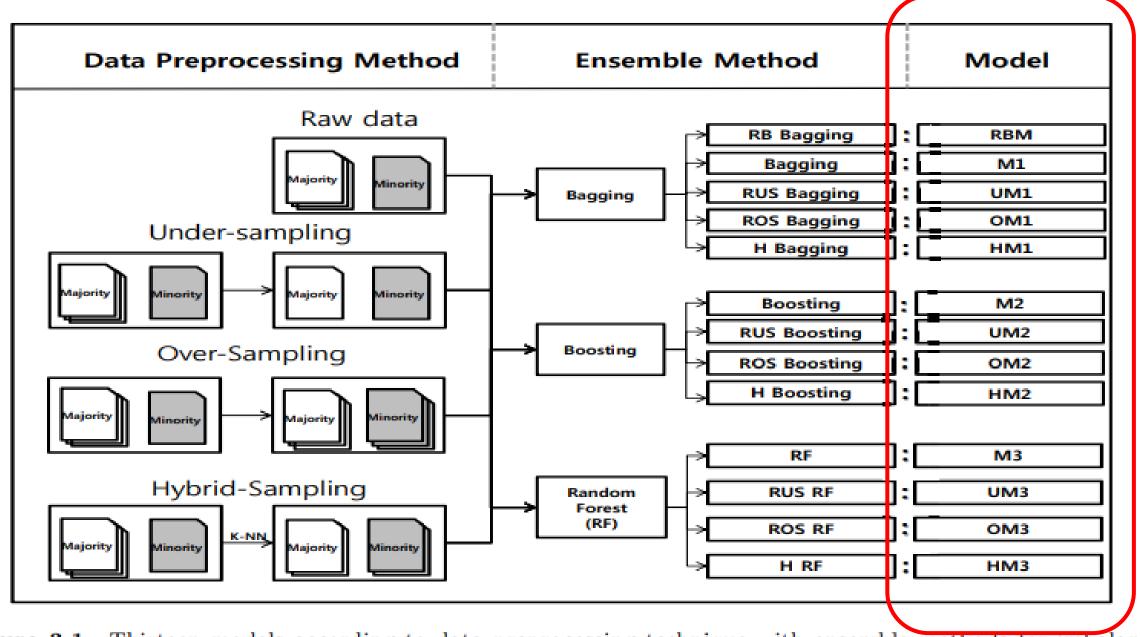

# Resampling technique vs. ensemble method

## #05 Resampling technique vs. ensemble method

 A Comparison of Ensemble Methods Combining Resampling Techniques for Class Imbalanced Data(논문)

- 13가지의 모형을
   \*불균형 데이터에 적합
   (7:3 분할, 100번 수행)
- 앙상블을 사용할 때 예측모형의 수를 100개로 똑같이 고정

Figure 3.1. Thirteen models according to data preprocessing technique with ensemble methods for imbalanced data

## #05 Resampling technique vs. ensemble method
